

Superseded by field cannot be pulled...

alblu02

Superseded by field cannot be pulled dragged and dropped from Universe to class folder. 19-May-2015 11:01 PM

Hi team,

Clients request:

Under a SDM 12.9 + CABI

Within the Configuration Item Detail Page, there is a field named "Superseded By" and I would like the ability to include it in a report.

The Superseded_by field appears to be an LREL field. I was able to locate it in the nr table in the Universe, but am not able to drag it to the tables. Do I need to create an Alias Attribute in CA in order to include this field? If so, I'm not sure of the Alias value.

I havent been able to get this to work internally. I tried attribute alias as superseded_by.name and saved successfully but still cannot use it within universe into a class Resources/Resource details class.

Thiughts?

Thanks and regards,

Luis Millan

Hi Luis,

Look for linked_relationships (lrel_asset_chgr) in the universe. That should give some clues on how to see lrel data.

The reason why you're not able to pull Superseded_By as is from right pane to Left pane is because it's a UUID field. You'd have to create a custom object on the left pane and use syntax like this: PdmString(nr.Superceded_By).

I don't think Attribute Alias would work in this case, as it's not an SREL.

Thanks Raghu,

Using `PdmString(nr.superseded_by)` does work bringing the CI's UUID but how do you extract the actual superseded CI name as seen under CI detail page?

Regards,
Luis Millan

Hi Raghu,.

I was thinking this route. Does it make sense to work?

Superseded by field cannot be pulled...

Edit Properties of Superseded By

Definition | Properties | Advanced | Keys | Source Information

Name: Type:

Description:

Select: >>

Where: >>

Tables... Parse

OK Cancel Apply Help

With the above approach - I could get it to work only by editing the sql in the report level as below:

Superseded by field cannot be pulled...

Given that you're pulling information of two different records from same table, this approach makes sense to me.

Its rather a unique case. Creating a Derived table (HOW? I'm not sure yet. I remember seeing some derived table like nr1 nr2..) for such might help
